Sponsored by the Energy Division, N.C. Department of Commerce, with State Energy Conservation Program Funds and the Tennessee Valley Authority for the U.S. Department of Energy with Southeastern Regional Biomass Energy Program Funds, in cooperation with Western Carolina University, Mountain Resource Center. However, any opinions, findings, conclusions, or recommendations expressed herein are those of the authors and do not necessarily reflect the views of the Energy Division, N.C. Department of Commerce, the U.S. Department of Energy or the Tennessee Valley Authority.

Introduction

The Energy Division of the N.C. Department of Commerce commissioned this inventory to provide information in support of greater use of renewable solid fuels. The inventory entries provide data on specific commercial and industrial boilers burning solid fuels. Each entry includes the name and location of each boiler site, the type and amount of fuel being used by each boiler, and the Standard Industrial Classification (SIC) number associated with the good or service being produced on-site. The entries are grouped in alphabetical order by facility. The type of fuel being used, county of the site and the SIC codes have been indexed to allow the user to search for information by those categories. Finally, *Key Resources* have been supplied to facilitate information gathering as well as making contact with potential sources of technical assistance.

Target Audience

Solid Fuel Inventory in North Carolina was designed to aid anyone interested in investigating the use of renewable solid fuels; i.e., wood, refuse-derived fuel, municipal solid waste, etc. for either planned facilities or conversion of existing large boilers.

Procedures

This publication used data originating from several North Carolina state government sources, including the N.C. Department of Commerce and N.C. Department of Environment, Health and Natural Resources.

How to Use the Inventory

The inventory is arranged to help the reader select entry information by name, county location, SIC code, or type of fuel. All of these categories of information are contained within the entries, which are grouped by facility name. The facilities are arranged in alphabetical order. Three indexes reference entries by county, fuel type, and Standard Industrial Classification (SIC). The indexes will list facilities alphabetically under each index heading.

Overview and Background

Recognizing the need to support alternative fuel sources, the Energy Division, N.C. Department of Commerce responded to a statewide information gap concerning users of wood fuel by publishing in 1986 the *Inventory of Industrial Wood Fired Boilers in North Carolina*. Seeking to update that inventory, while expanding that inventory to include other alternative fuels as well as wood, *Solid Fuel Inventory in North Carolina* provides information on a variety of solid fuels including wood. Most solid fuel users are in the industrial and commercial sectors; however, any large facility or complex generating energy on-site with solid fuels has been included. Since 1973, solid fuels such as wood have risen in use in response to rising oil prices and stricter environmental regulations (TVA, p.1). These economic pressures have motivated new energy technologies, resulting in opportunities and choices that can lead to a more sustainable economy and safer environment. There are several varieties of solid fuels reported in this inventory and these alternative fuels and combinations of particularly renewable energy sources must be considered for industrial, commercial, institutional and individual needs (NCDC, Energy Division, p.1).

The solid fuels considered in this inventory include:

Coal — According to the *Solid Fuel Inventory in North Carolina*, coal accounts for over 85 percent of solid fuel being used in North Carolina. Currently a vital solid fuel for North Carolina, coal and information presented on coal-burning facilities were considered essential to fulfilling the inventory's goal of supporting more sustainable energy practices.

Wood Wastes — Wood wastes considered in this inventory are defined by SCC numbers. Wood in any form is a locally available, renewable source of fuel that produces negligible sulfur dioxide and lower amounts of nitrogen oxides than coal (RTI, p.1-1). Sixty percent of all land in North Carolina is timberland (NCCES, p.1); however, wood provides less than 1 percent of all U.S. electric power production (RTI, p.1-1), indicating a tremendous untapped resource readily available to North Carolina's commercial community.

Agricultural Wastes — Agricultural wastes included in this inventory are primarily crop residues; i.e., plant stalks, shells, leaf material, etc. that are combustible and can be used as a solid fuel (Riall and Bouffier, p. 26). As this inventory focused on solid fuels, agricultural wastes that have nonsolid fuel potentials were not included.

Municipal Solid Wastes (MSW) — The solid wastes generated by residential, commercial, and municipal activities make up an alternative solid fuel that can be used to fire boilers for steam and electricity production (Riall and Bouffier, p. 40).

Tire-Derived Fuel (TDF) — Used truck and passenger vehicle tires can be processed into a combustible solid fuel, which requires special permitting. Currently, the inventory has no listings of an active TDF boiler in the state of North Carolina.

Refuse-Derived Fuel (RDF) — Refuse-derived fuels are any fuel products derived from solid wastes, typically utilizing mechanical, chemical or biochemical processes (NREL, p.1).

Other — Solid fuels that were mixed in nature and fall under multiple classifications or facilities burning different classifications of fuels at different times.

The adaptation of renewable solid fuels can:

- Ameliorate carbon dioxide
- Reduce land devoted to sanitary landfills
- Strengthen the state economy
- Reduce dependence on fossil fuels, particularly foreign oil
- Improve the trade balance
- Reduce the negative impacts of increases in energy prices (Riall and Bouffier, p.8).

The Energy Division of the N.C. Department of Commerce is providing this inventory in its efforts to support and facilitate the adoption of renewable solid fuels for a more sustainable society. The inventory documents current and potential users of renewable solid fuels such as wood, agricultural wastes, municipal solid wastes, refuse-derived fuels and tire-derived fuels.

General Conclusions

The *Solid Fuel Inventory in North Carolina* reveals solid fuels in current use as presented in Table 1 below. Figures are based primarily on North Carolina Regulatory Agency data which is required to be reported annually by facility.

Table 1 - Current Annual Tonnage of Solid Fuels Used

| Fuel Type | Current Annual Tonnage Used |
|-----------------------|---|
| Coal | 23,266,279.20 |
| Wood | 3,673,002.45 |
| Agricultural Wastes | None reported |
| Tire-derived Fuel | None reported |
| Municipal Solid Waste | 72,000.00 (includes refuse-derived fuels) |
| Other | 134,870.00 |

Table 2 - Number of Boilers in Use by Fuel Type

| Fuel Type | Total Boilers in Use |
|-----------------------|------------------------------|
| Coal | 221 |
| Wood | 322 |
| Agricultural Wastes | None reported |
| Tire-derived Fuel | 2 (Permitted but not in use) |
| Municipal Solid Waste | 4 |
| Other | 29 |

Table 2 presents information on the number of boilers burning any given fuel type covered in the inventory.

Key Resources

The following listing of key resources within North Carolina was prepared to provide information and assistance on a wide range of solid fuel energy issues. The listing includes representatives of the N.C. Department of Commerce, the N.C. Department of Environment, Health and Natural Resources, the Industrial Extension Service of North Carolina State University and the Waste Management Institute of North Carolina A & T State University.
